

New Developments in Car Hands-free Testing – the ITU-T Focus Group FITCar

H.W. Gierlich

Since January 2007 ITU-T has established the Focus Group FITCar (from/in/to Car Communication). The goal of this Focus Group is to setup a specification for handset and headset terminals used in car type environments. In the Focus Group the relevant stakeholders coming from the telecom industry, the car industry, the suppliers and universities participate.

In the presentation the new specification as developed for car hands-free terminals is introduced. New techniques such as tests based on electrical access points, Bluetooth testing as well as new requirements compared to the well known VDA specification will be introduced.
